EXPERIMENT 13

Case Study on the Limitations of Low-Code Platforms for a Complex Enterprise Use Case

Application: Loan Application & Pre-Screening Management

Aim

To study the limitations of Zoho Creator for a complex enterprise use case, using the Loan Application & Pre-Screening Management application built in this lab.

Procedure

1. **Use case chosen:** a large bank needs one loan application system for many branches. It must collect applications, validate the data, connect to other systems such as a CRM, give different access to loan officers and managers, and show reports and charts to management.
2. **What was built:** the form Loan_Application_Form with its fields (Experiment 4), a dashboard page with a chart and a report (Experiment 5), a Deluge validation workflow (Experiment 6), a Zoho CRM connection attempt (Experiment 7) and user permissions (Experiment 8).
3. **Each requirement was tried in Zoho Creator** in the account used for the lab, and the exact message or setting shown on the screen was noted. The limits found are listed in the Result.

Result

The following limits were seen while building the application:

1. **Field settings (Experiment 4):** the Number field Monthly_Income only offers Max Digits and has no minimum value, and the Date field Preferred_Callback_Date has no setting to block past dates. Such rules had to be written as Deluge validation.
2. **Workflow editor (Experiment 6):** pressing the Escape key to close the auto-complete list closed the Deluge editor and the typed script was lost.
3. **Connections (Experiment 7):** the Zoho CRM connection could not be authorized. The Zoho Accounts window showed "Cannot grant these permissions as you don't have access to CRM." and Zoho Creator then showed that the authorization had failed, so the Create Contact action could not be saved.
4. **Users and access (Experiment 8):** the Permissions tab showed the message Confirm Email Account, and permission sets and roles could be added only after the email account was confirmed.
